Datasheet

Name: Ultra High Sensitivity and Low Power GPS Receiver Module

Model No.: SKG13BL

Version: V3.02

Revision History:

Revision	Description	Approved	Date
V1.01	Initial Release to V1.01	George	20120703
V2.03	Update set baud rate	George	20141229
V3.01	Update firmware	Sunny	20150312
V3.02	Update certification information	George	20170831

General Description

The SKG13BL is a complete GPS module that features with super sensitivity, ultra low power and small form factor. The GPS signal is applied to the antenna input of module, the serial interface output NMEA protocol data or customer protocol data with position, velocity and time information.

It is based on the high performance features of the MediaTek MT3337 single-chip architecture, Its -165dBm tracking sensitivity extends positioning coverage into place like urban canyons and dense foliage environment where the GPS cannot fix before. The small form factor and low power consumption make the module easy to integrate into portable device like PNDs, mobile phones, cameras and vehicle navigation systems.

Applications

- LBS (Location Based Service)
- PND (Portable Navigation Device)
- Vehicle navigation system
- Mobile phone

Figure 1: SKG13BL Top View

Features

- Ultra high sensitivity: -165dBm
- Extremely fast TTFF at low signal level
- Built-in 12 multi-tone active interference canceller
- Ultra low power consumption
- ±10ns high accuracy time pulse (1PPS)
- NMEA Output: GGA,GSA,GSV,RMC,VTG,GLL
- Support QZSS
- Advanced Features: Aiding EPO;EASY
- Small form factor: 15x13x2.4mm
- RoHS compliance (Lead-free)
- FCC,CE compliance

Interfaces Configuration

Power Supply

Regulated power for the SKG13BL is required. The input voltage Vcc should be 3.0V to 4.2V range, current is no less than 100mA. Suitable decoupling must be provided by external decoupling circuitry (10uF and 1uF). It can reduce the Noise from power supply and increase power stability.

Main power supply Vcc current varies according to the processor load and satellite acquisition. Maximum Vcc peak current is about 30 mA during acquisition.

Backup Battery Power

In case of a power failure on pin Vcc, real-time clock and backup RAM are supplied through pin V_BCKP. This enables the SKG13BL GPS Receiver to recover from power failure with either a hot start or a warm start (depending

on the duration of Vcc outage). If no Backup Battery is connected, the receiver performs a cold start upon powered up. Backup Battery Power V_BCKP draws typically 7 uA current in backup state.

Reset

The SKG13BL modules include a RESET pin. Driving RESET low activates a hardware reset of the system. RESET is only an input and will not reset external circuitry. At power down the reset is forced when the Vcc drops below 2.7V.

NOTE

If not used, leave RESET not connected (floating).

Antenna

The SKG13BL GPS receiver is designed for supporting the active antenna or passive antenna connected with pin RF_IN. The gain of active antenna should be no more than 25dB (18~20dB Typical). The maximum noise figure should be no more than 1.5dB and output impedance is at 50 Ohm.

NOTE

With passive antenna keep the cable loss at minimum(<1dB).

UART Ports

UART0 is use for NMEA output and command input, UART1 is use for RTCM input. The UART0 Baud rate can be configured as seen in table below . Default settings in bold.

Baud rate	Pin14:B115200	Pin15:B4800
9600bps	NC	NC
4800bps	NC	10K pull-down
115200bps	10K pull-down	NC
38400bps	10K pull-down	10K pull-down

RF_IN

The transmission line must to be control impedance from RF_IN pin to the antenna or antenna connector of your choice. (Impedance 50Ω)

PPS

A pulse per second (1 PPS) is an electrical signal that very precisely indicates the start of one second. Depending on the source, properly operating PPS signals have an accuracy ranging 10ns. The PPS signals are used for precise timekeeping and time measurement.

Advanced Software Features

AIC_Multi-tone active interference canceller

Because different application (Wi-Fi , GSM/GPRS,3G/4G,Bluetooth)are integrated into navigation system , the harmonic of RF signal will influence the GPS reception , The multi- tone active-interference canceller can reject external RF interference which come from other active components on the main board , to improve the capacity of GPS reception without any needed HW change in the design .SKG12BL can cancel up to 12 independent channel interference continuous wave.

EASY™

The EASY™ is embedded assist system for quick positioning, the GPS engine will calculate and predict automatically the single emperies (Max. up to 3 days)when power on ,and save the predict information into the memory , GPS engine will use these information for positioning if no enough information from satellites , so the function will be helpful for positioning and TTFF improvement under indoor or urban condition ,the Backup power (VBACKUP) is necessary .

Aiding EPO

The Aiding EPO supply the predicated Extended Prediction Orbit data to speed TTFF ,users can download the EPO data to GPS engine from the FTP server by internet or wireless network ,the GPS engine will use the EPO data to assist position calculation when the navigation information of satellites are not enough or weak signal zone .

Manufacturing Process Recommendations

Figure 8: SKG13BL Typical Leadfree Soldering Profile

Note: The final soldering temperature chosen at the factory depends on additional external factors like choice of soldering paste, size, thickness and properties of the baseboard, etc. Exceeding the maximum soldering temperature in the recommended soldering profile may permanently damage the module.

Software Protocol

NMEA 0183 Protocol

The NMEA protocol is an ASCII-based protocol, Records start with a \$ and with carriage return/line feed. GPS specific messages all start with \$GPxxx where xxx is a three-letter identifier of the message data that follows. NMEA messages have a checksum, which allows detection of corrupted data transfers.

The Skylab SKG13BL supports the following NMEA-0183 messages: GGA, GLL, GSA, GSV, RMC, VTG. The module default NMEA-0183 output is set up GGA, GLL, GSA, GSV, RMC VTG , and default baud rate is set up 9600bps.
