4 蓝牙 AT 指令解析/Bluetooth AT Command parsing

4.1 AT 指令格式/AT Command format

指令串由五个部分构成: 指令头、指令、参数连接符、 [参数]、结束符, 指令头为:"AT+"或"AT?", 参数连接符为"=", 结束符为"\r\n", 参数连接符、参数为可选项(即可以带参数、也可以不带参数), 当指令串携带有参数则表示设置指令, 若不带参数则表示查询指令。

The Command string consists of five parts: Command header, Command, parameter connector, [parameter], and terminator. The Command header is "AT+" or "AT? , the parameter concatenator is "=", and the end character is "\r\n". The parameter concatenator and parameter are optional (either with or without parameters). If the Command string contains parameters, it indicates that the Command is set; if it does not, it indicates that the Command is queried.

注意: 串口数据 20ms 作为一帧数据的超时, AT 指令识别以 AT+或 AT?开头, 后续参数不对 (如格式, 参数, 长度等) 会返回错误, 反之返回正确 (如错误[AT]ER, 正确[AT]OK)。在进行主和 (或) 从连接后, AT 命令依然识别, 不作为透传数据, 若不以 AT+或 AT?开头则视为透传数据进行转发

Note: Serial port data 20ms as a frame of data timeout, AT Command recognized as AT+ or AT? Error ([AT]ER, correct [AT]OK); error ([AT]ER); After a master and/or slave connection is made, the AT command is still recognized and does not act as passthrough data. If the AT+ or AT? At the beginning, it is regarded as transparent data for forwarding.

举例/For example:

设置广播间隔指令/Sets the broadcast interval command: **AT+ADVINTVL=1000\r\n**

查询广播间隔指令/Query broadcast interval instruction: **AT+ADVINTVL\r\n**
